

Think Measles

It isn't just a little rash

Measles can be dangerous, especially for babies and young children, pregnant women and people with a weak immune system.

Measles is very contagious

Measles spreads through the air when an infected person coughs or sneezes. It can spread very quickly and easily in busy or crowded places.

Dear students,

In response to a rise in measles cases in the UK and Europe, the HSE is providing MMR catch up clinics on campus to protect people who may not have been vaccinated before.

If you missed the MMR vaccine when you were a child, you can get the vaccine at this clinic.

If you are not sure if you have had the MMR vaccine when you were a child, you can still get the vaccine now to make sure you're protected.

Measles is a highly infectious disease that can cause serious complications, in people of all ages.

MMR vaccination is the best way to protect yourself and others from measles.

Two doses of MMR vaccine are necessary to be considered fully vaccinated.

The HSE vaccination team on campus are available to answer any questions you may have.
