29th April 2021

Deputy Higgins
Dáil Éireann,
Leinster House
Dublin 2

PQ Ref 22443/21 To ask the Minister for Health if antigen testing is being considered as a means for allowing pregnant women to be accompanied by a partner in hospital for the entirety of their labour and birth.

Dear Higgins

The Health Service Executive has been requested to reply directly to you in the context of the above Parliamentary Question, which you submitted to the Minister for Health for response. I have examined the matter and the following outlines the position.

Since the commencement of the Covid-19 pandemic, maternity services have been committed to ensuring that to the best of their ability the impact of Covid-19 on services and the pregnancy experience of every mother and their partner should be kept to an absolute minimum wherever feasible. Every restriction and deviation from normal practice across the country is a cause of concern and deeply regretted at local and national level. Maternity services and their dedicated staff are acutely aware of how unique the pregnancy journey is for each woman and her family and are mindful how the presence of loved ones can offer unique support and care in this journey.

With regard to the presence of partners or support personnel at maternity appointments, labour wards and delivery theatres, it is of course desirable that the impact of Covid-19 on the experience of women and their families in maternity care is kept to an absolute minimum. In this regard the National Women & Infants Health Programme can provide absolute assurance that the midwifery and obstetric community are acutely aware of the important support provided by partners or companions and that service providers across the 19 services wish to facilitate this as far as possible.

Maternity services are a core, essential service and as such need to be able to provide 24/7 care to all women requiring it as the country continues to deal with the Covid-19 pandemic. However, it should be noted that in the context of the current public health emergency, each of our 19 maternity units/hospitals are facing significant challenges. Such challenges may vary considerably between units and, indeed, over time as the situation evolves with a range of factors needing to be taken into account including staffing levels, infrastructure, local rates of infections, national advice etc. In that context it is important to remember that any changes to how services operate, including restrictions, are put in place to minimise the risk of spread of Covid-19 in the community and to protect hospital staff and patients as much as possible.

The Health Protection Surveillance Centre has issued guidance regarding attendance at hospitals during the pandemic, which includes attendance at maternity hospitals. The guidance advises that restrictions on partners' visiting; accompanying persons in labour; or parents visiting neonatal intensive care units, should be based on a documented risk assessment that is regularly reviewed. Risk assessments are carried out in individual hospitals and are not collated centrally and if an individual patient wants to know why their hospital has restrictions in place this information should be available at a local level.

With regards to the antigen testing of partners, in so far as we are aware no hospitals are doing this, and there are no plans for it to be implemented.

In the context that the situation regarding community transmission continues to improve, and as the immunisation of frontline workers begins to take effect, NWIHP has engaged with the clinical leads in each of the maternity networks to request that as part of their on-going review of their policies at local and regional level, that these two elements would now be factored in, hopefully with a view to current arrangements being altered, with NWIHP continuing to advise that the overarching need remains the requirement to protect the health of our pregnant population in so far as possible.

Finally, it should be acknowledged that the recent association between COVID placentitis and still birth underlines the importance of keeping maternity as safe as possible. As the numbers of COVID in the community decrease and as the number of adults being vaccinated increases the maternity community looking forward to a return to normality.

All involved in the provision of maternity services are aware of the difficulty and distress that the current restrictions on accompanying persons due to COVID 19 have caused. All service providers look forward to the restoration of normal visiting and the accommodation of partners.

I trust this clarifies the matter.

Yours sincerely,

Mary-Jo Biggs, General Manager, National Women and Infants Health Programme
