Influenza Vaccination Campaign 2022/2023

Dear Principals,

Information about the **2022/2023 children's influenza vaccination campaign**.

All children aged 2-17 can get the free flu vaccine

The nasal flu vaccine is now available in Ireland for children aged 2-17. Participating GP practices and Pharmacies are giving the vaccine. It is given as a spray up the nose, there is no need for an injection. It is a safe, easy and pain free way to help protect children against flu this winter.

Last year when HSE vaccination teams delivered the nasal flu vaccine in 3 primary schools as part of a pilot vaccination programme the uptake of the vaccine increased from 12% to 76%. This year we are encouraging GPs and Pharmacies to link in with schools to offer the free flu vaccine to children. You may also wish to approach your local GP or Pharmacy to partner with your school to increase access to the vaccine for children e.g. setting up a flu vaccine clinic on school premises. Consent can be gained from parents beforehand, similar to the approach taken with other school based vaccinations and will be managed by the vaccination team.

The flu vaccine will also help reduce the spread of flu to others such as siblings, parents, teachers at high risk of flu complications (e.g. pregnant or chronic health conditions) and grandparents.

Flu can be serious in children

Children are twice as likely to get the flu than adults. While most children who get the flu will have mild symptoms, some children can get complications such as pneumonia or bronchitis and may need to go to hospital. Children, especially younger children, are also more likely than adults to get severe complications of flu.

Flu can cause serious illness in children, and children with chronic health conditions are most at risk of severe complications of flu.

Symptoms of flu in children include

- High temperature
- Muscle pains
- Headache
- Extreme tiredness (fatigue)

Children also carry the flu virus in their system longer than adults do. They can spread the flu virus easily to other children, like those in day-care centres and schools, and to older and vulnerable people around them. The flu vaccine will give children the best protection against flu.

Wider benefits of the flu vaccine for children

Children who are sick with flu can sometimes miss weeks in school. If enough children are vaccinated against flu, fewer children and adults will need to see their doctor or need treatment in hospital because of flu.

Getting the nasal flu vaccine and other vaccines

Children can get the flu vaccine at the same time as the COVID-19 vaccine if they have not yet had it.

It is also safe for children to get the nasal flu vaccine at the same time or before and after any of the vaccines that may be offered to them through the HSE's schools immunisation programme. The 4 in 1 and MMR vaccine are offered in Junior Infants and the HPV, Tdap and MenACWY vaccine are offered to first years.

Supporting the flu campaign this year

The flu vaccine is the best protection we have against flu. We would appreciate it if you could take suitable opportunities to promote the flu vaccine with parents and promote flu facts (attached at the end of this letter).

You may also find the following resources helpful:

- HSE flu website: www.hse.ie/flu. It also contains further information about the flu vaccines available this year (including the injectable flu vaccines for adults) and all those who are recommended the flu vaccine.
- Information leaflet for parents (in English and translations available on the flu website): <https://bit.ly/LAIVLeaflet>
- Poster on the Children's Flu vaccine (in English and Irish translation available on the flu website): <https://bit.ly/LAIVPosterE>

As always, we thank you for your support for the flu vaccination programme.

Yours Sincerely,

Dr Lucy Jessop
Director of Public Health
National Immunisation Office
