

**BCG Vaccine SSI**

Powder and solvent for suspension for injection.

**Read all of this leaflet carefully before you receive this vaccine.**
- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you. Do not pass it on to others.
- If any of the side effects gets serious or if you notice any side effects not listed in this leaflet, please tell your doctor or pharmacist.

---

**In this leaflet:**
1. What BCG Vaccine SSI is and what it is used for
2. Before you receive BCG Vaccine SSI
3. How you are vaccinated with BCG Vaccine SSI
4. Possible side effects
5. How to store BCG Vaccine SSI
6. Further information

**1. WHAT BCG VACCINE SSI IS AND WHAT IT IS USED FOR**

BCG Vaccine SSI contains bacteria of the type *Mycobacterium bovis* BCG and is used for protection against tuberculosis (TB).

**2. BEFORE YOU RECEIVE BCG VACCINE SSI**

You should not be vaccinated with BCG Vaccine SSI
- If you have known allergies to any of the ingredients in the vaccine
- If you have a fever or generalised skin infection. In these cases vaccination should be postponed
- If you have a weakened resistance toward infections due to a disease in/of your immune system
- If you are receiving medical treatment that affects the

---

The following information is intended for medical and healthcare professionals only

**Special warnings and precautions for use**

The vaccine should be administered strictly by the intradermal route.

The vaccine should preferably be administered by personnel trained in the intradermal vaccination technique.

Inadequate administered injections e.g. subcutaneously or intramuscularly increase the risk of lymphadenitis and abscess formation.

A local reaction at injection site followed by a local lesion

The expected reactions to the vaccination include:
- a slight swelling, redness and tenderness at the injection site followed by a local lesion
- some weeks later this lesion evolves into a small ulcer
- after some months this ulcer will heal leaving a small, flat scar
- a slight swelling of the lymph nodes in the armpit may be experienced

These are common reactions to the vaccination.

---

The expected reactions to the vaccination include:

1. Swelling
2. Tenderness
3. A local lesion
4. An ulcer
5. A scar

---

**3. HOW YOU ARE VACCINATED WITH BCG VACCINE SSI**

The doctor or nurse will give the vaccination by injection into the upper layer of the skin.

The dose is 0.05 ml for children under 12 months of age and 0.1 ml for adults and children aged 12 months or more.

The injection site is best left uncovered to facilitate healing.

---

**Possible side effects**

The expected reactions to the vaccination include:

- a slight swelling, redness and tenderness at the injection site followed by a local lesion
- some weeks later this lesion evolves into a small ulcer
- after some months this ulcer will heal leaving a small, flat scar
- a slight swelling of the lymph nodes in the armpit may be experienced

These are common reactions to the vaccination.

---

**Using a syringe fitted with a long needle, transfer to the vial the volume of solvent stated on the label. Do not use other diluents, as these may damage the vaccine. Carefully invert the vial a few times to the resuspend the lyophilised BCG completely. Do not shake the vial. Gently swirl the vial with the reconstituted vaccine before drawing up each subsequent dose. When drawn up into the syringe the reconstituted vaccine should appear homogenous, slightly opaque and colourless. When reconstituted the vaccine should be used immediately.**

**Method of administration**

The vaccine should be administered by personnel trained in the intradermal technique.

The injection site should be clean and dry.

**Antiseptics should not be used prior to administration.**

**Methods for skin sterilization**

- **Method 1:** Clean the skin with a 70% alcohol solution. Allow to dry before injection.
- **Method 2:** Clean the skin with a 70% alcohol solution. Allow to dry before injection.
- **Method 3:** Clean the skin with a 70% alcohol solution. Allow to dry before injection.

**Handling**

The rubber stopper must not be wiped with any antiseptic or detergent. If alcohol is used to swab the rubber stopper, it must be allowed to evaporate before the stopper is penetrated with the syringe needle.
4. POSSIBLE SIDE EFFECTS

Like all medicines, BCG Vaccine SSI can cause side effects, although not everybody gets them. Severe allergic reactions (such as redness of the face and neck, swelling of the face, throat or neck, skin rash, breathing difficulties and collapse) may occur in rare cases (less than 1 in 1,000).

If you observe any of the above reactions contact your doctor immediately.

Other side effects include:

<table>
<thead>
<tr>
<th>Uncommon side effects (may occur in less than 1 in 100 people)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fever</td>
</tr>
<tr>
<td>Swelling of lymph nodes in the armpit larger than 1 cm across</td>
</tr>
<tr>
<td>An oozing ulcer at the injection site</td>
</tr>
<tr>
<td>Headache</td>
</tr>
</tbody>
</table>

Rare side effects (may occur in less than 1 in 1,000 people)

- Inflammation of lymph nodes, sometimes with oozing ulcers, possibly abscess
- Infection with the bacteria from the vaccine can occur. The infection can spread throughout the body, including the bones

Fainting, seizures and convulsions among patients receiving injections have been observed.

If any of the side effects gets serious, or if you notice any side effects not listed in this leaflet, please tell your doctor or pharmacist.

Some side effects require treatment.

5. HOW TO STORE BCG VACCINE SSI.

- Keep out of the reach and sight of children
- Store in a refrigerator (2°C - 8°C)
- Store in the original package in order to protect from light
- Do not freeze
- Do not use the vaccine after the expiry date which is stated on the carton as "EXP"
- The expiry date refers to the last day of that month
- Any unused vaccine should be disposed of according to local regulations

6. FURTHER INFORMATION

What BCG Vaccine SSI contains

The active substance is: Freeze-dried powder containing live attenuated bacteria of the type Mycobacterium bovis BCG (Bacillus Calmette-Guerin), Danish strain 1331. 1 ml vaccine contains between 2 - 8 million bacteria. The other ingredients are: Sodium glutamate, magnesium sulphate heptahydrate, dipotassium phosphate, l-asparagine monohydrate, ferric ammonium citrate, glycerol 85%, citric acid, monohydrate and water for injections.

This medicinal product contains less than 1 mmol sodium (23mg) per dose, i.e. essentially 'sodium-free'

What BCG Vaccine SSI looks like and contents of the pack

BCG Vaccine SSI consists of a powder and solvent for suspension for injection (2-8 x 10^4 bacteria/0.1 ml dose or 1-4 x 10^5 bacteria/0.05 ml dose). Pack sizes of 1, 5, or 10 vials and pack size of 1 vial with one syringe and two injection needles (one long for adding solvent and one short for intradermal injection).

The powder in the amber vial is white and crystalline, the powder might be difficult to see due to the small amount of powder in the vial.

The solvent in the clear vial is a colourless solution without visible particles.

The mixed vaccine should appear as a homogenous, slightly opalescent, colourless suspension.

Pack sizes: 5 vials BCG Vaccine SSI + 5 vials Diluted Sauton SSI packed in the same box

Treatment of complications after vaccination with BCG Vaccine SSI

Expert advice should be sought regarding the appropriate treatment regimen for the management of systemic infections or persistent local infections following vaccination with BCG Vaccine SSI.

Antibiotic sensitivity of the BCG strain:

The table below indicates the minimum inhibitory concentrations (MIC) for selected anti-tuberculous drugs towards the BCG Danish strain 1331 [as determined by Bactec 460].

The MIC for isoniazid is 0.4 mg/l. There is no consensus as to whether Mycobacterium bovis BCG should be classified as susceptible, intermediate susceptible or resistant to isoniazid when the MIC is 0.4 mg/l. However, based on criteria set for Mycobacterium tuberculosis, the strain could be considered to be of intermediate susceptibility.

<table>
<thead>
<tr>
<th>Drug</th>
<th>Minimum Inhibitory Concentration (MIC)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Isoniazid</td>
