Tips to help you

- At first it is probably a good idea to set aside some time for these exercises and really concentrate on getting them right. But quite soon they should become easy to do wherever you are. Nobody needs to know what you are doing!
- Get into the habit of doing your exercises with things you do regularly — every time you touch water if you are a housewife, every time you answer the phone if you are at the office — whatever you do often.
- If you are unsure that you are exercising the right muscle, put a finger on the anus/back passage as you squeeze, to check. You should feel a gentle lift and squeeze if you are exercising the right muscle. Or look at the area in a mirror — you should see the back passage/anus pucker up as you squeeze it.
- Use your muscles when you need them — pull up the muscles if you feel that you are about to leak. But remember that you cannot hold your tightest squeeze for very long, so you are better to use a gentler squeeze that you can hold for longer. Your control will gradually improve.
- Watch your weight - extra weight puts extra strain back passage/anus.
- Once you have regained control of your bowel, don't forget your exercises. Continue to do them 2-3 times each day to ensure that the problem does not come back. Remember - you can do these exercises wherever you are - nobody need know what you are doing!

Correct Position for opening your bowels

- Reducing intake of caffeine, artificial sweeteners and high fibre cereals sometimes helps.
- If you have sore skin or itching, ask for advice on skin care.
- For some people leakage will resolve by using a suppository to clear any remaining stool/motion after a bowel action.

Other things that may help

- The better you empty your bowel on the toilet, the less there will be to leak. So, take your time on the toilet and do some exercises before you wipe. This may "milk out" any remaining.
- Make sure you are sitting in the right position on the toilet Raising your feet on to a footstool about 30cm high when you are sitting on the toilet helps to empty the bowel more completely.
Introduction

Sphincter exercises can help you to improve leakage from the bowel. When done correctly, these exercises can build up and strengthen the muscles to help you to hold both gas/wind and stool/motion in the back-passage.

Where are these muscles?

The back passage, or anus, has two rings of muscle around it (see diagram).

- The inner ring is the internal sphincter, an involuntary muscle, which should be closed at all times, except when you are actually trying to open your bowels. This is normally automatic, you don’t have to think about closing it.
- The outer ring of muscle is the external sphincter, which is a voluntary muscle which you can tighten up to close it more firmly if you have an urgency or diarrhoea.
- Both muscles wrap right around the anus (back passage).
- Either or both of these sphincter muscles can become weak due to:
  - Childbirth
  - Constipation and straining
  - General wear and tear.
  - Sometimes there is no obvious reason.
- If you have weak muscles you may leak gas/wind, liquid or solid stools/motion.
- When you pass a stool/motion, there is usually a little of the stool/motion left behind in the anal canal (see diagram). Normally, the sphincter muscles “snap shut” after you have finished opening your bowels to close off the back passage. This squeezes out any remaining stool/motion. You can then wipe clean, and there is no further leakage.

Muscle does not close completely thus trapping the stool in the anus

• If the muscles are damaged or weak, they may not close immediately or completely after you have been to the toilet. This often makes it difficult to wipe clean, and you may find that you leak for a while after opening your bowels.
• This may be a small or a large amount and may last only a few minutes, or several hours.
• You may also find that you leak during strenuous exercise, lifting heavy weights or when you walk any distance.
• Some people find that a small amount of a stool/motion is passed with wind.
• Other people with weak muscles have a “funnel-shaped anus”. The weak muscle does not close completely at skin level and stool is trapped inside the anal opening. This cannot be removed easily just by wiping (see diagram below).

How can exercises help?

- The internal sphincter muscle, which is most often the problem underlying leakage, cannot be strengthened by exercises. It is an involuntary muscle, which you cannot work just by willpower.
- It is the external sphincter muscle that you can exercise.
  - The aim is to exercise this muscle enough to make it thicker and stronger so that it gives more support and may squeeze the internal muscle to prevent leakage.
  - Speeding the reaction of this muscle may also help with wind control. Like any other muscle in the body, the more you use and exercise it, the stronger the sphincter muscle will be.
  - However, this can often takes several months to become strong.

Learning to do the exercises

It is important to learn to do the exercises in the right way, and to check from time to time that you are still doing them correctly.

- Sit comfortably with your knees slightly apart. Now imagine that you are trying to stop yourself passing wind from the back passage.
- To do this you must squeeze the muscle around the back passage. Try squeezing and lifting that muscle as tightly as you can, as if you are really worried that you are about to leak.
- You should be able to feel the muscle move.
- Your buttocks, tummy and legs should not move at all.
- You should be aware of the skin around the back passage tightening and being pulled up and away from your chair. Really try to feel this.
- You are now exercising your anal sphincter.
