

Hospital Patient Safety Indicator Report

Hospital Name	Children's Health Ireland at Crumlin	Reporting Month	Feb 2019
---------------	--------------------------------------	-----------------	----------

- This report details the hospital's performance against some national and international measures of patient safety in acute hospitals.
- The metrics cover activities and performance areas including infection rates, staff hand hygiene, waiting times and clinical incidents.
- This report supports each hospital and hospital group to ensure a culture of quality and patient safety.
- We publish this report each month to assure our patients and staff that we prioritise patient safety and open disclosure.

Notes:

1. It is not intended that this report be used to compare performance of hospitals or hospital groups. Different hospitals specialise in treating patients with different and sometimes much more complex care needs, making comparisons between hospitals ineffective.
2. Metrics 1-3 measure infection control and staff hand hygiene practices in acute hospitals. These metrics are applied internationally as key indicators of infection control compliance. The targets for metrics 1 and 2 are international best practice targets. The target for metric 3 is an agreed target in the HSE's National Service Plan.
3. Metrics 4-8 measure access to and waiting times for services including emergency care, trauma care (for hip fractures), urgent endoscopy procedures and access to outpatient services. These metrics are based on national indicators and nationally agreed targets as set out in the HSE's National Service Plan
4. Metric 9 and 10 measure clinical incidents reported to the National Incident Management System. A clinical incident is an event or circumstance which could have, or did lead to unintended and/ or unnecessary harm. Incidents include adverse events which result in harm; near misses which could have resulted in harm, but did not cause harm, either by chance or timely intervention. These metrics are indicators of patient safety in hospitals that are applied internationally.
5. Metric 11 is an indicator of medication safety in acute hospitals. This refers to any preventable event that may cause or lead to inappropriate use or patient harm while the medication is in the control of the healthcare professional or patient (WHO, 2009). The number of errors reported to the National Incident Management System is based on an internationally accepted metric applied in other countries.
6. The data reported includes maternity data where appropriate.

Hospital Name:	Children's Health Ireland at Crumlin		Reporting Month		Feb 2019
	Ref	Metric	Reporting Frequency	Target	
Health Care Associated Infections	1	Rate of new cases of Hospital acquired Staph. aureus bloodstream infection	Monthly CPA51	Less than 1 per 10,000 bed days	2.2
