

National Office for Suicide Prevention

Briefing on CSO Suicide Figures

5th June 2018

Overview

In Ireland, the [Central Statistics Office](#) (CSO) provides mortality data including deaths by suicide. This data is provided in different stages;

1. Numbers of deaths are provided firstly based on year of registration – “provisional”
2. They are revised later, by year of occurrence – “official”
3. Finally they are revised later again, to include “late registrations”.

These numbers are not easily comparable across different years - at any given time, data for different years is at different stages. The following table gives the number of suicide deaths in Ireland since 2012, and highlights the stage of each dataset (as at June 2019);

Year	Number of suicide deaths	Male	Female	Type of data
2018	352	282	70	Provisional, year of registration data (CSO 31 st May 2019)
2017	392	312	80	Provisional, year of registration data (CSO 30 th May 2018)
2016	437	350	87	Official, year of occurrence data, excluding late registrations
2015	425	335	90	Official, year of occurrence data, excluding late registrations
2014	560	458	102	Official, year of occurrence data, including late registrations
2013	545	438	107	Official, year of occurrence data, including late registrations
2012	577	471	106	Official, year of occurrence data, including late registrations

The CSO also publishes data relating to undetermined deaths. It is currently not possible to estimate the proportion of undetermined deaths that are deaths by suicide.

1 Year of occurrence suicide data (official)

The *year of occurrence* data is more comprehensive and allows for year-on-year comparison, however, this data can change due to delayed Coroner inquests resulting in late registered suicide deaths. In 2016 (most recent year available) there were **437** deaths by suicide in Ireland; rate of 9.2 per 100,000 of the population. 80% of these deaths were male. This high male-to-female ratio is a constant feature of deaths by suicide over the years, as can be seen in the tables to follow.

Based on the most recent *year of occurrence* data (2016):

- Amongst males and females together, the suicide rate per 100,000 is highest amongst those aged 45-54 at 14.1 per 100,000. This trend is the case since 2010.
- Amongst males, the highest rate was in those aged 55-64, at 23.5 per 100,000. Between 2010 to 2015, the rate was highest in those aged 45-54.
- Amongst females, the highest rate was in those aged 15-24, at 6.7 per 100,000. In 2015, the rate was highest in those aged 55-64 and between 2012 to 2014 the rate was highest in those aged 45-54.

2 Year of registration suicide data (provisional)

On 31st May 2019, the CSO published *year of registration* data for 2018. This data shows that there were **352** deaths by suicide (282 Male and 70 Female) registered in 2018. The provisional figure for previous year (2017) is 392 (312 Male and 80 Female).

This data will be subject to change.

Numbers and rates of suicide and other causes of death, 2005-2018*

This table includes 'year of occurrence' and 'year of registration' data as published by the CSO. The table that follows includes late registered suicide deaths (i.e. deaths by suicide occurring in years for which the CSO have already published 'year of occurrence' data).

Year of occurrence data (2005-2014) updated to reflect late registered suicide deaths.

The table below includes revised *year of occurrence* data to reflect late registered suicide deaths (i.e. deaths by suicide occurring in years for which the CSO have already published *year of occurrence* data). Currently, 2014 is the most recent year for which the *year of occurrence* data has been updated to reflect late registered deaths.
