

FLOT Therapy-14 day

INDICATIONS FOR USE:

INDICATION	ICD10	Regimen Code	Reimbursement Status
Treatment of locally advanced ($\geq T2$) and/or nodal positive (N+) resectable gastric adenocarcinoma	C16	00344a	Hospital
Treatment of locally advanced ($\geq T2$) and/or nodal positive (N+) resectable adenocarcinoma of the oesophagogastral junction	C16	00344b	Hospital

TREATMENT:

The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patient's individual clinical circumstances.

DOCetaxel, oxaliplatin, folinic acid and 5-fluorouracil are administered on Day 1 of a 14 day cycle. Four neoadjuvant cycles are administered prior to surgery over 8 weeks and four adjuvant cycles are administered post-surgery over 8 weeks.

Facilities to treat anaphylaxis MUST be present when the chemotherapy is administered.

Order of Admin	Day	Drug	Dose	Route	Diluent & Rate	Cycle
1	1	DOCetaxel	50mg/m ²	IV infusion	^a 250ml 0.9% sodium chloride over 60min	Every 14 days
2	1	^b Oxaliplatin	85mg/m ²	IV infusion	^c 500ml glucose 5% over 2hrs ^d	Every 14 days
3	1	Folinic Acid ^e (Calcium leucovorin)	200mg/m ²	IV infusion	250ml glucose 5% over 2hrs	Every 14 days
4	1	Fluorouracil ^f	2600mg/m ²	Continuous IV infusion	Over 24h in 0.9% NaCl	Every 14 days

Secondary prophylaxis with G-CSF is recommended for patients who experience febrile neutropenia or treatment interruptions because of neutropenia or leucopenia.

^a75-185mg dose use 250mL infusion bag. For doses > 185mg use 500mL infusion bag
Use non-PVC infusion bag.

^bOxaliplatin is incompatible with 0.9% NaCl. Do not piggyback or flush lines with normal saline

^cFor oxaliplatin doses ≤ 104 mg use 250ml glucose 5%.

Oxaliplatin administration must always precede the administration of 5-FU.

Oxaliplatin may be given at the same time as Folinic Acid (*Calcium Leucovorin*) using a Y connector.

^dIncrease infusion rate time for oxaliplatin to 4 – 6 hours in case of laryngopharyngeal dysaesthesia reaction..

^eFolinic Acid (*Calcium Leucovorin*) must be administered prior to fluorouracil. It enhances the effects of fluorouracil by increasing fluorouracil binding to the target enzyme thymidylate synthetase.

^fSee dose modifications section for patients with identified partial DPD deficiency

NCCP Regimen: FLOT Therapy-14 day	Published: 08/09/2017 Review: 28/04/2026	Version number: 8
Tumour Group: Gastrointestinal NCCP Regimen Code: 00344	ISMO Contributor: Prof Maccon Keane	Page 1 of 7
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE's terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</p>		

ELIGIBILITY:

- Indications as above
- ECOG status 0-2
- Adequate haematological, renal and liver status

EXCLUSIONS:

- Hypersensitivity to DOCetaxel, oxaliplatin, 5-Fluorouracil or any of the excipients
- Severe hepatic impairment
- Severe renal impairment (creatinine clearance < 30ml/min)
- Known complete DPD deficiency

USE with CAUTION:

- Peripheral neuropathy \geq Grade 2

PRESCRIPTIVE AUTHORITY:

The treatment plan must be initiated by a Consultant Medical Oncologist.

TESTS:

Baseline tests:

- FBC, renal and liver profile
- DPD testing prior to first treatment with 5-fluorouracil using phenotype and/or genotype testing unless patient has been previously tested

Regular tests:

- FBC, renal and liver profile prior to each cycle.
- Evaluate for peripheral neuropathy every 2 cycles or as clinically indicated

Disease monitoring:

Disease monitoring should be in line with the patient's treatment plan and any other test/s as directed by the supervising Consultant.

DOSE MODIFICATIONS:

- Consider a reduced starting dose in patients with identified partial DPD deficiency.
 - Initial dose reduction may impact the efficacy of treatment. In the absence of serious toxicity, subsequent doses may be increased with careful monitoring.
- Any dose modification should be discussed with a Consultant

Haematological:

Table 1: Dose modification for haematological toxicity

ANC (x 10 ⁹ /L)		Platelets (x 10 ⁹ /L)		WBC (x 10 ⁹ /L)	Dose of DOCEtaxel and Oxaliplatin
≥1	and	≥ 100	and	≥ 3	100% Dose
Thrombocytopenia with bleeding					Dose reduce to 75%
Febrile neutropenia: First occurrence Second occurrence (despite use of G-CSF) Further occurrences					Consider the use of G-CSF Dose reduce to 75% Dose reduce to 50%
G-CSF secondary prophylaxis recommended for patients who experience febrile neutropenia or treatment interruptions because of neutropenia or leucopenia					

Renal and Hepatic Impairment:

Table 2: Dose modification in renal and hepatic impairment

Drug	Renal impairment		Hepatic Impairment		
DOCEtaxel	No dose reduction necessary		See Table 3 below		
Oxaliplatin	CrCl (ml/min)	Dose	Little information available. Probably no dose reduction necessary. Clinical decision.		
	>30	Treat at normal dose and monitor renal function			
	<30	Contraindicated			
5-Fluorouracil	Consider dose reduction in severe renal impairment only		Bilirubin (micromol/L)	AST	Dose
			<85	<180	100%
			>85	or >180	Contraindicated
			Clinical decision. Moderate hepatic impairment; reduce initial dose by 1/3. Severe hepatic impairment, reduce initial dose by 1/2. Increase dose if no toxicity		

Table 3: Dose modification of DOCEtaxel in hepatic impairment

Alkaline Phosphatase		AST and/or ALT		Serum Bilirubin	Dose
> 2.5 ULN	and	> 1.5 ULN		</= ULN	100%
> 6 ULN	and/or	> 3.5 ULN (AST and ALT)	and	> ULN	Stop treatment unless strictly indicated and should be discussed with a Consultant.

Non-haematological toxicity:

Table 4: Dose modification schedule based on adverse events

Adverse reactions	Recommended dose modification
Grade >2 non-haematological toxicity	
First occurrence	Decrease dose of all drugs to 75%
Second occurrence	Decrease dose of all drugs to 50%

NCCP Regimen: FLOT Therapy-14 day	Published: 08/09/2017 Review: 28/04/2026	Version number: 8
Tumour Group: Gastrointestinal NCCP Regimen Code: 00344	ISMO Contributor: Prof Maccon Keane	Page 3 of 7

Oxaliplatin induced neuropathy:

Table 5: Dose modification of oxaliplatin due to oxaliplatin induced neuropathy

<p>*Peripheral neuropathy Grade 2 present at start of cycle Grade 3</p> <ul style="list-style-type: none"> • First occurrence • 2nd occurrence • Persistent <p>Grade 4</p>	<p>Reduce oxaliplatin to 65mg/m²</p> <p>Reduce oxaliplatin to 65mg/m²</p> <p>Reduce oxaliplatin to 50mg/m²</p> <p>Discontinue oxaliplatin</p> <p>Discontinue oxaliplatin</p>
---	---

*Neuropathy may be partially or wholly reversible after discontinuation of therapy; patients with good recovery from Grade 3 (not Grade 4) neuropathy may be considered for re- challenge with oxaliplatin, with starting dose one level below that which they were receiving when neuropathy developed.

SUPPORTIVE CARE:

EMETOGENIC POTENTIAL:

DOCEtaxel:	Low (Refer to local policy)
Oxaliplatin:	Moderate (Refer to local policy)
5-Fluorouracil:	Low (Refer to local policy)

PREMEDICATIONS:

- Dexamethasone 8 mg PO twice daily for 3 days, starting one day prior to each DOCEtaxel administration unless contraindicated. Patient must receive minimum of 3 doses pre-treatment.
- **Consideration may be given, at the discretion of the prescribing consultant, to the use of a single dose of dexamethasone 20mg IV immediately before chemotherapy where patients have missed taking the oral premedication dexamethasone as recommended by the manufacturer (4,5).**

OTHER SUPPORTIVE CARE:

Medication may be required for management of diarrhoea, e.g. loperamide (4mg at first onset followed by 2mg after each loose stool (max 16 mg /day) or see local policy.

ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

- **Neutropenia:** Most frequent adverse reaction. Fever or other evidence of infection must be assessed promptly and treated appropriately. Frequent blood count monitoring should be conducted in all patients treated with DOCEtaxel
- **Extravasation:** DOCEtaxel causes pain and tissue necrosis if extravasated. Oxaliplatin causes irritation if extravasated. (Refer to local extravasation guidelines).

DOCEtaxel

- **Neutropenic Enterocolitis:** A number of cases of neutropenic enterocolitis have been reported in patients treated with DOCEtaxel in France (7). This is a known and rare side effect of DOCEtaxel which may affect up to one in 1,000 people.
- **Hypersensitivity Reactions:** Patients should be observed closely for hypersensitivity reactions especially during the first and second infusions of DOCEtaxel. Hypersensitivity reactions may occur within a few minutes following the initiation of the infusion of DOCEtaxel, thus facilities for the treatment of

The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE's terms of use available at <http://www.hse.ie/eng/Disclaimer>

This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens

hypotension and bronchospasm should be available. However, severe reactions, such as severe hypotension, bronchospasm or generalised rash/erythema require immediate discontinuation of DOCEtaxel and appropriate therapy. Patients who have developed severe hypersensitivity reactions should not be re-challenged with DOCEtaxel.

- **Fluid Retention:** Dexamethasone premedication must be given to reduce the incidence and severity of fluid retention with DOCEtaxel. It can also reduce the severity of the hypersensitivity reaction.

5-Fluorouracil

- **Gastrointestinal toxicity:** Patients treated with fluorouracil should be closely monitored for diarrhoea and managed appropriately.
- **Dihydropyrimidine dehydrogenase (DPD) deficiency:** DPD is an enzyme encoded by the DPYD gene which is responsible for the breakdown of fluoropyrimidines. Patients with DPD deficiency are therefore at increased risk of fluoropyrimidine-related toxicity, including for example stomatitis, diarrhoea, mucosal inflammation, neutropenia and neurotoxicity. Treatment with 5-Fluorouracil, capecitabine or tegafur-containing medicinal products is contraindicated in patients with known complete DPD deficiency. Consider a reduced starting dose in patients with identified partial DPD deficiency. Initial dose reduction may impact the efficacy of treatment. In the absence of serious toxicity, subsequent doses may be increased with careful monitoring. Therapeutic drug monitoring (TDM) of fluorouracil may improve clinical outcomes in patients receiving continuous 5-fluorouracil infusions.
- **Hand-foot syndrome (HFS):** HFS, also known as palmar-plantar erythrodysesthesia (PPE) has been reported as an unusual complication of high dose bolus or protracted continuous therapy for 5-fluorouracil.

Oxaliplatin

- **Platinum Hypersensitivity:** Special surveillance should be ensured for patients with a history of allergic manifestations to other products containing platinum. In case of anaphylactic manifestations the infusion should be interrupted immediately and an appropriate symptomatic treatment started. Re-administration of oxaliplatin to such patients is contraindicated.
- **Laryngopharyngeal dysesthesia:** An acute syndrome of laryngopharyngeal dysesthesia occurs in 1% - 2% of patients and is characterised by subjective sensations of dysphagia or dyspnoea/feeling of suffocation, without any objective evidence of respiratory distress (no cyanosis or hypoxia) or of laryngospasm or bronchospasm. Symptoms are often precipitated by exposure to cold. Although antihistamines and bronchodilators have been administered in such cases, the symptoms are rapidly reversible even in the absence of treatment. Prolongation of the infusion helps to reduce the incidence of this syndrome.

DRUG INTERACTIONS:

- Risk of drug interactions causing increased concentrations of DOCEtaxel with CYP3A inhibitors and decreased concentrations of DOCEtaxel with CYP3A inducers.
- Marked elevations of prothrombin time and INR have been reported in patients stabilized on warfarin therapy following initiation of fluorouracil regimens.
- Concurrent administration of fluorouracil and phenytoin may result in increased serum levels of phenytoin.
- Fluorouracil is contraindicated in combination with brivudin, sorivudin and analogues as these are potent inhibitors of the 5-FU-metabolising enzyme dihydropyrimidine dehydrogenase (DPD).
- Current drug interaction databases should be consulted for more information.
