</tbody>
</table>

TREATMENT:
The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patient's individual clinical circumstances.

CARBOplatin is administered once every 7 days concomitantly with radiotherapy for 7 weeks to start 3 to 8 weeks (day 22 to day 56) following start of third cycle of induction chemotherapy. (Reference NCCP Regimen 00315 Neoadjuvant DOCEtaxel, CISplatin, 5-Fluorouracil and Chemoradiation and Surgery or NCCP Regimen 00323 DOCEtaxel, CISplatin and 5-Fluorouracil Chemoradiation Therapy for details of induction chemotherapy).

CARBOplatin is only to be administered concurrently with radiotherapy. Treatment with CARBOplatin should be discontinued if radiotherapy is truncated.

**CARBOplatin dose:**
The dose in mg of CARBOplatin to be administered is calculated as follows:

\[ \text{Dose (mg)} = \text{target AUC (mg/ml x min) x (GFR ml/min +25)} \]

- Measured GFR (e.g. nuclear renogram) is preferred whenever feasible
- Estimation of GFR (eGFR) can be done by using the Wright formula or using the Cockroft and Gault formula to measure creatinine clearance
- The GFR used to calculate the AUC dosing should not exceed 125ml/min.
- For obese and anorexic patients the formulae may not give accurate results and measured GFR is recommended. Where obesity or overweight is likely to lead to an overestimate of GFR and

The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient’s care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE’s terms of use available at http://www.hse.ie/eng/Disclaimer

This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens
isotope GFR is not available the use of the adjusted ideal body weight for Cockroft and Gault may be considered (4).

**WRIGHT FORMULA**

There are two versions of the formula depending on how serum creatinine values are obtained, by the kinetic Jaffe method or the enzymatic method. The formula can be further adapted if covariant creatine kinase (CK) values are available (not shown).

1. **SCr measured using enzymatic assay.**
   
   \[
   GFR \text{ (ml/min)} = \frac{(6230 - 32.8 \times \text{Age}) \times \text{BSA} \times (1 - 0.23 \times \text{Sex})}{\text{SCr (micromol/min)}}
   \]

2. **SCr measured using Jaffe assay**

   \[
   GFR \text{ (ml/min)} = \frac{(6580 - 38.8 \times \text{Age}) \times \text{BSA} \times (1 - 0.168 \times \text{Sex})}{\text{SCr (micromol/min)}}
   \]

Key: Sex = 1 if female, 0 if male; Age in years; BSA= DuBois BSA

**COCKCROFT-GAULT FORMULA**

\[
GFR \text{ (ml/min)} = S \times \frac{(140 - \text{age in years}) \times \text{wt (kg)}}{\text{serum creatinine (micromol/L)}}
\]

S= 1.04 for females and 1.23 for males

**ELIGIBILITY:**
- Indications as above
- ECOG status 0-2

**EXCLUSIONS:**
- Hypersensitivity to CARBOplatin or any of the excipients.
- Disease progression while receiving platinum based chemotherapy
- Pregnancy or lactation

**PRESCRIPTIVE AUTHORITY:**
The treatment plan must be initiated by a Consultant Medical Oncologist
TESTS:

Baseline tests:
- Blood renal and liver profile

Regular tests:
- FBC, renal and liver profile before each cycle

Disease monitoring:
Disease monitoring should be in line with the patient’s treatment plan and any other test/s as directed by the supervising Consultant.

DOSE MODIFICATIONS:
- Any dose modification should be discussed with a Consultant.

Haematological:

Table 1: Dose modification of CARBOplatin in haematological toxicity

<td>100%</td>
</tr>
<tr>
<td>&lt; 1 and &lt; 100</td>
<td></td>
<td>Delay one week or until recovery</td>
</tr>
</tbody>
</table>

For some patients especially ECOG 2, treatment thresholds may be higher.

Renal and Hepatic Impairment:

Table 2: Dose modification of CARBOplatin in renal and hepatic impairment

<table>
<thead>
<tr>
<th>Renal Impairment</th>
<th>Hepatic Impairment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patients with creatinine clearance values of &lt; 60 ml/min are at greater risk to develop myelosuppression.</td>
<td>Probably no dose modification required</td>
</tr>
<tr>
<td>In case of GFR ≤ 20 ml/min carboplatin should not be administered at all.</td>
<td></td>
</tr>
<tr>
<td>If Cockroft &amp; Gault or Wright formula are used, the dose should be adjusted per cycle based on a serum creatinine obtained within 48 hrs of drug administration.</td>
<td></td>
</tr>
<tr>
<td>If isotope GFR is used, the dose should remain the same provided the serum creatinine is ≤110% of its value at the time of the isotope measurement. If the serum creatinine is higher than this, consideration should be given to remeasuring the GFR or to recalculating using Cockroft &amp; Gault or Wright formulae taking care this does result in a dose reduction.</td>
<td></td>
</tr>
</tbody>
</table>

SUPPORTIVE CARE:

EMETOGENIC POTENTIAL: Moderate (Refer to local policy).

PREMEDICATIONS: Not usually required

OTHER SUPPORTIVE CARE: No specific recommendations
ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS
The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full
details.

- **Neutropenia**: Fever or other evidence of infection must be assessed promptly and treated appropriately.
- **Hypersensitivity**: Reactions to CARBOplatin may develop in patients who have been previously exposed to platinum therapy. However allergic reactions have been observed upon initial exposure to CARBOplatin.
- **Neurotoxicity and ototoxicity**: Neurological evaluation and an assessment of hearing should be performed on a regular basis, especially in patients receiving high dose CARBOplatin. Neurotoxicity, such as parasthesia, decreased deep tendon reflexes, and ototoxicity are more likely seen in patients previously treated with CISplatin, other platinum treatments and other ototoxic agents. Frequency of neurologic toxicity is also increased in patients older than 65 years

DRUG INTERACTIONS:

- Avoid concurrent use with nephrotoxic drugs (e.g. aminoglycosides, furosemide, NSAIDS) due to additive nephrotoxicity. If necessary, monitor renal function closely.
- Avoid concurrent use with ototoxic drugs (e.g. aminoglycosides, furosemide, NSAIDS). If necessary, perform regular audiometric testing.
- Current drug interaction databases should be consulted for more information.

ATC CODE:
CARBOplatin - L01XA02
