

Escalated Dose BEACOPP 21 day Therapy

INDICATIONS FOR USE:

INDICATION	ICD10	Regimen Code	Reimbursement Status
Treatment of patients with high risk, advanced stage Hodgkin Lymphoma (IPS ≥ 3)	C81	00354a	Hospital
Escalation of treatment of patients with Hodgkin Lymphoma after failure to reach complete metabolic response post 2 cycles of ABVD	C81	00354b	Hospital

TREATMENT:

The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patient's individual clinical circumstances.

The treatment is administered every 21 days for 4 cycles unless disease progression or unacceptable toxicity develops. This can be increased to 6 cycles at the consultant's discretion.

Facilities to treat anaphylaxis MUST be present when the chemotherapy is administered.

Day	Drug	Dose	Route	Diluent and Rate
1	^a Cyclophosphamide	1250mg/m ²	IV infusion	250ml 0.9% NaCl over 30 min
1	^b DOXOrubicin	35mg/m ²	IV Bolus	Slow IV bolus over 15 min with 0.9% NaCl
1,2,3	^c Etoposide	200mg/m ²	IV infusion	1000ml 0.9% NaCl over 3 hours
8	^d vinCRISTine	1.4mg/m ² (cap at 2mg)	IV infusion	50ml 0.9% NaCl over 15 min
8	^e Bleomycin	10mg/m ² (10,000IU/ m ²)	IV Bolus	Into the side arm of a fast running 0.9% NaCl infusion
1-7	^f Procarbazine	100mg/m ²	PO	Daily Procarbazine is available as 50mg capsules, round dose to nearest 50mg.
1-14	^g Prednisolone	40mg/m ²	PO	Single daily dose in the morning
9-13 approx.	G-CSF (Round to nearest whole syringe)	5micrograms/kg	SC	until ANC >1x10 ⁹ /L for 3 days

^aConsideration could be given to the administration of MESNA 250mg/m² IV at T0, T+4 and T+8hr after administration of the cyclophosphamide at the discretion of the prescribing consultant

^bLifetime cumulative dose of DOXOrubicin is 450mg/m² **In establishing the maximal cumulative dose of an anthracycline, consideration should be given to the risk factors outlined below¹ and to the age of the patient.**

^cThe etoposide 200mg/m² dose may need to be split into two 1000ml bags for stability reasons. These should be administered sequentially

^dvinCRISTine is a neurotoxic chemotherapeutic agent. Refer to NCCP Guidance on the Safe Use of Neurotoxic drugs (including Vinca Alkaloids) in the treatment of cancer [here](#)

^eThe total cumulative dose of bleomycin should NOT exceed 400,000 international units.

The risk of pulmonary toxicity increases beyond a cumulative dose of 300,000 international units. Check the cumulative dose prior to each treatment

^fProcarbazine is an unlicensed drug. If the drug is not to be dispensed by the hospital, then the hospital should ensure communication with the patient's community pharmacy to ensure there is no interruption in treatment

^gAlternative steroid regimens with tapering doses may be used at consultant discretion, eg 60mg od for 14 days, 40mg od for 2 days, 20mg od for 2 days, 15mg od for 1 day, 10mg od for 1 day, 5mg od for 1 day-,then, stop* (21 days in total)

NCCP Regimen: Escalated Dose BEACOPP 21 day Therapy	Published: 15/04/2019 Review: 15/04/2021	Version number:2
Tumour Group: Lymphoma NCCP Regimen Code: 00353	IHS Contributors: Dr Hilary O'Leary, Dr Kamal Fadalla ISMO Contributor : Prof Maccon Keane	Page 1 of 7

The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician, and is subject to HSE's terms of use available at <http://www.hse.ie/eng/Disclaimer>

This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens

ELIGIBILITY:

- Indications as above
- ECOG status 0-2

EXCLUSIONS:

- Hypersensitivity to bleomycin, DOXOrubicin, cyclophosphamide, etoposide, vinCRISTine or any of the excipients
- Age \geq 60 years
- Bleomycin is contraindicated in patients with acute pulmonary infection or chest X rays suggesting diffuse fibrotic changes or greatly reduced lung function
- Severe liver impairment (etoposide)
- Breast feeding
- Pregnancy

PRESCRIPTIVE AUTHORITY:

The treatment plan must be initiated by a Consultant Medical Oncologist or Consultant Haematologist working in the area of haematological malignancies.

TESTS:

Baseline tests:

- FBC, renal and liver profile
- ECG
- Cardiac function using MUGA or ECHO (LVEF > 50% required to administer doxorubicin) if >65 years or if clinically indicated (e.g. smoking history, hypertension).
- Pulmonary function tests (PFTs) prior to bleomycin
- Virology screen - Hepatitis B (HBsAg, HBcoreAb), Hepatitis C, HIV.
*See Adverse Effects/Regimen Specific Complications re Hepatitis B Reactivation

Regular tests:

- FBC, renal and liver profile prior to each cycle on day 1
- Chest x-ray +/- PFTs, as clinically indicated

Disease monitoring:

Disease monitoring should be in line with the patient's treatment plan and any other test/s, as directed by the supervising Consultant.

DOSE MODIFICATIONS:

- Full dose intensity should be maintained where possible
- Dose modification should only be carried out following discussion and approval by the consultant.

Haematological:

Table 1: Haematological Criteria to proceed with next cycle of treatment

	White Cell Count		Platelets	
Day 1	>2.5 X 10 ⁹ /L	and	> 80 X 10 ⁹ /L	Cycle proceeds

- If these values are not reached on day 1 of the next scheduled cycle of treatment, therapy is postponed and FBC should be checked again after 3, 7, 10 and 14 days or until blood count recovery.
- Bleomycin and vinCRiStine should be administered on schedule and at full dose even if leucopenia is observed on day 8.

Dose modifications (De-escalation as per HD15 protocol, Engert et al (3))

There is a predefined scheme for dose de-escalation for BEACOPP Escalated Therapy.

Ensure to discuss with consultant prior to implementing dose modifications as dose intensity should be maintained where possible

- The dose in all subsequent cycles will be reduced by one dose level should one or more toxic events occur in a given cycle (see Table 2 below).
- If any toxic event occurs in 2 successive cycles, the subsequent cycle is administered at baseline dose.
- Once dose levels have been reduced, they are not re-escalated for subsequent cycles.

Consider requirement for dose reduction (as per table 2 below) for the following toxic events.

Toxic events include:

- Grade 4 neutropenia or thrombocytopenia
- Grade 4 leucopenia for more than 4 days (White cell count < 1 x 10⁹/L)
- Other grade 4 toxicity
-

Table 2: Dose reduction levels for Escalated BEACOPP

Level	Cyclophosphamide (Day 1)	DOXorubicin (Day 1)	Etoposide (Day 1)
*4	1250 mg/m ²	35 mg/m ²	200 mg/m ²
3	1100 mg/m ²	35 mg/m ²	175 mg/m ²
2	950 mg/m ²	35 mg/m ²	150 mg/m ²
1	800 mg/m ²	35 mg/m ²	125 mg/m ²
Baseline	650 mg/m ²	25 mg/m ²	100 mg/m ²

*Starting Level

Renal and Hepatic Impairment:

Table 3: Recommended dose modifications based on renal and hepatic impairment

Drug	Renal Impairment		Hepatic Impairment			
Cyclophosphamide	CrCl (ml/min)	Dose	Severe impairment: Clinical decision			
	>20	100%				
	10-20	75%				
	<10	50%				
Bleomycin	CrCl (ml/min)	Dose	Clinical decision			
	>50	100%				
	10-50	75%				
	<10	50%				
DOXOrubicin	No dose reduction required. Clinical decision in severe renal impairment.		Bilirubin (micromol/L)	Dose		
			20-51	50%		
			51-85	25%		
			>85	omit		
			If AST 2-3x normal, give 75% dose. If AST >3x ULN, give 50% dose.			
Etoposide	CrCl (ml/min)	Dose	Bilirubin (micromol/L)		AST	Dose
	>50	100%	26-51	or	60-180	50%
	15-50	75%	>51	or	>180	Clinical decision
	<15	50%	Subsequent doses should be based on clinical response			
Procarbazine	Caution is advisable in patients with renal dysfunction. Avoid use if creatinine clearance is less than 10mL/min		Bilirubin (micromol/L)		AST	Dose
			>50			Consider dose reduction
			>85	or	>180	Contraindicated
VinCRISTine	No dose reduction required		Bilirubin (micromol/L)		AST/ALT	Dose
			26-51	or	60-180	50%
			>51	and	N	50%
			>51	and	>180	Omit
			Consider if liver impairment is disease related			

Neurotoxicity:

Table 4: Dose modification of vinCRISTine based on neurotoxicity (CTCAE v 4.0)

Peripheral neuropathy	Dose of VinCRISTine
Grade 1	100%
Grade 2	Hold until recovery, then reduce dose by 50
Grade 3,4	Omit

SUPPORTIVE CARE:

EMETOGENIC POTENTIAL:

- High - Day 1-7 (Refer to local policy)
- Minimal - Day 8 (Refer to local policy)

PREMEDICATIONS:

None usually required

OTHER SUPPORTIVE CARE:

- Tumour lysis syndrome prophylaxis (**Refer to local policy**)
- Proton pump Inhibitor (**Refer to local policy**)
- PJP prophylaxis (**Refer to local policy**)
- Anti-viral prophylaxis (**Refer to local policy**)
- Anti-fungal prophylaxis (Avoid the concurrent use of azoles and vinCRiStine (6) (**Refer to local policy**))
- Prophylactic regimen against vinCRiStine induced constipation is recommended (**Refer to local policy**)
- Patients should have an increased fluid intake of 2-3 litres on day 5 to prevent haemorrhagic cystitis associated with cyclophosphamide.
- All patients should receive irradiated blood products – refer to local policy for notification procedure
- Consider referral for fertility preservation

ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

- **Neuropathy:** vinCRiStine may cause peripheral neuropathy, which is dose related and cumulative, requiring monitoring before each dose is administered. The presence of pre-existing neuropathies or previous treatment with other neurotoxic drugs may increase risk of peripheral neuropathy. Patients with mild peripheral neuropathy can usually continue to receive full doses of vinCRiStine, but when symptoms increase in severity and interfere with neurologic function, dose reduction or discontinuation of the drug may be necessary. The natural history following discontinuation of treatment is gradual improvement, which may take up to several months. A routine prophylactic regimen against constipation is recommended for all patients receiving vinCRiStine sulphate. Paralytic ileus may occur. The ileus will reverse itself upon temporary discontinuance of vinCRiStine and with symptomatic care.
- **Pulmonary toxicity:** Bleomycin may cause severe and life threatening pulmonary toxicity. Pulmonary toxicity of bleomycin is both dose-related and age-related. It may also occur when lower doses are administered, especially in elderly patients; in patients with reduced kidney function, pre-existing lung disease, previous or concurrent radiotherapy to the chest and in patients who need administration of oxygen. It is significantly exacerbated by thoracic radiation and by hyperoxia used during surgical anaesthesia. Smoking is also a risk factor.
- **Cardiac Toxicity:** DOXOrubicin is cardiotoxic and must be used with caution, if at all, in patients with cardiac dysfunction.
- **Extravasation:** DOXOrubicin and vinCRiStine cause pain and possible tissue necrosis if extravasated (refer to local policy).
- **Hepatitis B Reactivation:** All lymphoma patients should be tested for both HBsAg and HBcoreAb, as

per local policy. If either test is positive, such patients should be treated with lamivudine 100 mg/day orally for the entire duration of chemotherapy and for six months afterwards. Such patients should also be monitored with frequent liver function tests and hepatitis B virus DNA at least every two months. If the hepatitis B virus DNA level rises during this monitoring, management should be reviewed with an appropriate specialist with experience managing hepatitis and consideration given to stopping chemotherapy.

DRUG INTERACTIONS:

- DOXorubicin cardiotoxicity is exacerbated by previous or concurrent use of other anthracyclines or other potentially cardiotoxic drugs (e.g. 5-Fluorouracil, cyclophosphamide or PACLitaxel) or products affecting cardiac function (e.g. calcium antagonists).
- Bleomycin causes sensitisation of lung tissue to oxygen. If oxygen is required, the use of low concentration (e.g. 25%) is recommended. Fluid replacement should be carefully monitored
- Procarbazine is a weak MAO inhibitor and therefore, interactions with certain foodstuffs and drugs, although very rare, can occur. Thus, owing to possible potentiation of the effect of barbiturates, narcotic analgesics (especially pethidine), drugs with anticholinergic effects (including phenothiazine derivatives and tricyclic antidepressants), other central nervous system depressants (including anaesthetic agents) and anti-hypertensive agents, these drugs should be given concurrently with caution and in low doses.
- Intolerance to alcohol (Disulfiram-like reaction) may occur with procarbazine.
- Current drug interaction databases should be consulted for more information, including potential for interactions with CYP3AR inhibitors/inducers.

ATC CODE:

Cyclophosphamide	-	L01AA01
DOXorubicin	-	L01DB01
Etoposide	-	L01CB01
vinCRISTine	-	L01CA02
Bleomycin	-	L01DC01
Procarbazine	-	L01XB01

Comments and feedback welcome at oncologydrugs@cancercontrol.ie.

ⁱ Cardiotoxicity is a risk associated with anthracycline therapy that may be manifested by early (acute) or late (delayed) effects.

Risk factors for developing anthracycline-induced cardiotoxicity include:

- high cumulative dose, previous therapy with other anthracyclines or anthracenediones
- prior or concomitant radiotherapy to the mediastinal/pericardial area
- pre-existing heart disease
- concomitant use of other potentially cardiotoxic drugs

In establishing the maximal cumulative dose of an anthracycline, consideration should be given to the risk factors above and to the age of the patient
