

Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy

INDICATIONS FOR USE:

INDICATION	ICD10	Regimen Code	Reimbursement Status
Daratumumab in combination with bortezomib, thalidomide and dexAMETHasone for the treatment of adults with newly diagnosed multiple myeloma who are eligible for autologous stem cell transplant.	C90	00755a	Daratumumab : ODMS 1/6/2022 Bortezomib: Hospital Thalidomide: CDS

TREATMENT:

The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, considering each patient’s individual clinical circumstances.

The dosing schedule for daratumumab in combination with bortezomib, thalidomide and dexAMETHasone is based on a 28-day cycle regimen as detailed in the treatment tables below (Table 1 and 2).

Four cycles of induction therapy are administered (**Please refer to NCCP regimen 00703 Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Induction Therapy**), followed by the option of two cycles of consolidation therapy post high dose chemotherapy and ASCT.

Facilities to treat anaphylaxis MUST be present when the systemic anti-cancer therapy (SACT) is administered.

Table 1: Daratumumab dosing schedule in combination with bortezomib, thalidomide and dexAMETHasone

Treatment Phase	Weeks	Schedule
Induction (Refer to NCCP regimen 00703)	Weeks 1-8	Weekly (total of 8 doses)
	Weeks 9-16 ^a	Every two weeks (total of 4 doses)
Stop for high dose chemotherapy and ASCT		
Consolidation	Weeks 1-8 ^b	Every two weeks (total of 4 doses)

^a First dose of the every-2-week dosing schedule is given at Week 9

^b First dose of the every-2-week dosing schedule is given at Week 1 upon re-initiation of treatment following ASCT

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 1 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient’s care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE’s terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p style="text-align: center;"><i>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</i></p>		

Table 2: Treatment table for daratumumab, bortezomib, thalidomide and dexAMETHasone

Consolidation Therapy, Cycles 1-2 (week 1-8, total of 4 doses of daratumumab)

Day	Drug	Dose	Route	Diluent and Rate	Cycle frequency
1, 15	Daratumumab ^a	1800mg	SC	Over 3 to 5 mins	28 days
1, 4, 8, 11	Bortezomib	1.3mg/m ²	^{b, c} SC (abdomen or thigh)	n/a	28 days
1 – 28	Thalidomide	100 mg ^d PO (preferably nocte)	PO	n/a	28 days
1, 2, 8, 9, 15, 16	dexAMETHasone	20mg ^e	PO	n/a	28 days

^a If a planned dose of daratumumab is missed, the dose should be administered as soon as possible and the dosing schedule should be adjusted accordingly, maintaining the treatment interval.

^b Note: In individual cases where approved by Consultant, bortezomib may be administered as IV bolus over 3-5 seconds through a peripheral or central intravenous catheter followed by a flush with 0.9% NaCl. Note the concentration of bortezomib solution should be 1mg/ml when administered via the IV route

^c The solution should be injected subcutaneously, at a 45-90° angle. Injection sites should be rotated for successive injections. If local injection site reactions occur, either a less concentrated solution may be administered SC or a switch to intravenous injection is recommended. At least 72 hours should elapse between consecutive doses of bortezomib. Bortezomib is a proteasome inhibitor and is neurotoxic. Refer to **NCCP Guidance on the Safe Use of Neurotoxic drugs (including Vinca Alkaloids) in the treatment of cancer.**

^d Patients may be started at a dose of thalidomide 50mg at the discretion of the prescribing consultant

^e A reduced dose of 20 mg/week may be considered for patients >75 years, for patients with a Body Mass Index (weight in kg divided by the square of the height in metres) <18.5 and for patients with poorly controlled diabetes mellitus or prior intolerance/adverse event to steroid therapy.

Table 3: Dosing schedule for consolidation (Cycles 1 and 2)

ELIGIBILITY:

- Indication as above
- ECOG 0-2
- Patients with pre-existing severe neuropathy should be treated with thalidomide and bortezomib only after careful risk/benefit assessment. Caution should be exercised as further treatment may result in severe prolonged neuropathy.

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 2 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE's terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</p>		

EXCLUSIONS:

- Hypersensitivity to daratumumab, bortezomib, thalidomide or dexAMETHasone or any of the excipients
- Pregnancy
- Breastfeeding
- Severe uncontrolled obstructive airways disease/asthma
- Grade 2 or higher peripheral neuropathy or neuropathic pain
- Patients who are unable to comply with the Thalidomide Pregnancy Prevention Programme
- Acute diffuse infiltrative pulmonary and pericardial disease

PRESCRIPTIVE AUTHORITY:

- The treatment plan must be initiated by a Consultant Haematologist working in the area of haematological malignancies

TESTS:

Baseline tests:

- FBC, renal, liver and bone profile
- Uric acid
- Neutrophil count of $\geq 1.0 \times 10^9/L$ and platelets $\geq 50 \times 10^9/L$
- Urine pregnancy testing or serum hCG test for women of child bearing potential as per Pregnancy Prevention Programme
- Send a "group and save" sample to transfusion and inform patient and transfusion laboratory that patient is due to commence daratumumab. Patient will require red cell phenotyping as cross match fails due to binding of daratumumab to red cells.
- Virology screen - EBV, CMV, Hepatitis B (HBsAg, HBcoreAb) & C, HIV ***See Adverse Effects/Regimen Specific Complications re Hepatitis B Reactivation**
- Blood pressure, Blood glucose* if being treated with oral hypoglycaemics (*See Drug Interactions)
- Assessment of peripheral neuropathy status
- VTE risk assessment
- Assessment and registration as per Thalidomide Pregnancy Prevention Programme for both male and female patients

Regular tests:

- FBC; monitor platelet count **at a minimum** of day 1 and day 11 each cycle.

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a

- Renal, liver and bone profile
- Blood pressure, blood glucose* if being treated with oral hypoglycaemics (*See Drug Interactions)
- Urine pregnancy testing or serum hCG test every 28 days for female of childbearing potential as per Pregnancy Prevention Programme.

Disease monitoring:

Disease monitoring should be in line with the patient’s treatment plan and any other test/s as directed by the supervising Consultant.

DOSE MODIFICATIONS:

- Any dose modification should be discussed with a Consultant.
- No dose reductions of daratumumab are recommended.
 - Dose delay may be required to allow recovery of blood cell counts in the event of haematological toxicity (see table 5 below)

Table 4: Dose reduction steps for bortezomib

Dose Level	Dose
Starting dose	1.3mg/m ²
Dose level 1	1.0mg/m ²
Dose level 2	0.7mg/m ²
Dose level 3	Discontinue

Haematological:

Table 5: Dose modification of daratumumab and bortezomib for haematological toxicity

Drug	ANC (x10 ⁹ /L)		Platelets (x10 ⁹ /L)		Dose Modification
Daratumumab	≥0.5 - 1	Or	≥25 - 50	With bleeding	Consider withholding treatment until symptoms of the toxicity have resolved
	<0.5	Or	<25		Consider withholding treatment until symptoms of the toxicity have resolved
Bortezomib	<0.5	Or	<25		Withhold treatment until symptoms of the toxicity have resolved. Treatment may be reinitiated at the next lower

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a

					dose level If the toxicity is not resolved or if it recurs at the lowest dose, discontinuation of bortezomib must be considered unless the benefit of treatment clearly outweighs the risk
--	--	--	--	--	--

Renal and Hepatic Impairment:

Table 6: Recommended dose modification for renal or hepatic impairment

Drug	Renal impairment	Hepatic impairment			
Daratumumab	No formal studies of daratumumab in patients with renal impairment have been conducted. Based on a population pharmacokinetic (PK) analysis no dosage adjustment is necessary for patients with renal impairment	No formal studies of daratumumab in patients with hepatic impairment have been conducted. Based on population PK analyses, no dosage adjustments are necessary for patients with hepatic impairment			
Bortezomib	No dose adjustment is needed Haemodialysis: No dose adjustment is needed	Grade of Hepatic Impairment*	Bilirubin Level	(AST) levels	Modification of starting dose
		Mild	≤1 x ULN	> ULN	None
			>1-1.5 x ULN	Any	None
		Moderate	>1.5-3 x ULN	Any	Reduce dose to 0.7mg/m ² in the first treatment cycle. Consider dose escalation to 1mg/m ² or further dose reduction to 0.5mg/m ² in subsequent cycles based on patient tolerability.
Severe	>3 x ULN	Any			
Thalidomide	No specific dose recommendations	No specific dose recommendations. Monitor patients with severe hepatic impairment closely for adverse reactions			

*Based on NCI Organ Dysfunction Working Group classification for categorising hepatic impairment (mild, moderate, severe).

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 5 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Management of adverse events:

Table 7: Recommended dose modifications of bortezomib and thalidomide for neuropathy

Drug	Severity of neuropathy	Dose Modification
Bortezomib	Grade 1 (asymptomatic; loss of deep tendon reflexes or paresthesia) with no pain or loss of function	None
	Grade 1 with pain or Grade 2 (moderate symptoms; limiting instrumental Activities of Daily Living (ADL))	Reduce dose to 1 mg/m ² or change treatment schedule to 1.3mg/m ² once every week
	Grade 2 with pain or Grade 3 (severe symptoms; limiting self-care ADL)	Withhold treatment until symptoms of toxicity have resolved. When toxicity resolves re-initiate treatment and reduce dose to 0.7mg/m ² once every week
	Grade 4 (life-threatening consequences; urgent intervention indicated) and/or severe autonomic neuropathy	Discontinue treatment
Thalidomide	Grade 2	Reduce dose or interrupt treatment and continue to monitor the patient with clinical and neurological examination. If no improvement or continued worsening of the neuropathy, discontinue treatment. If the neuropathy resolves to Grade 1 or better, the treatment may be restarted, if the benefit/risk is favourable.
	Grade 3 or 4	Discontinue treatment

Table 8: Dose modification schedule of bortezomib and thalidomide based on other adverse events

Drug	Adverse reactions	Recommended dose modification
Bortezomib	Grade ≥3 Non-haematological toxicity	Withhold bortezomib until symptoms resolved to Grade 1 or baseline then reinitiate with one dose level reduction from 1.3mg/m ² to 1 mg/m ² or from 1mg/m ² to 0.7mg/m ² If the toxicity is not resolved or if it recurs at the lowest dose, discontinuation of bortezomib must be considered unless the benefit of treatment clearly outweighs the risk.
	New or worsening pulmonary symptoms (e.g. cough, dyspnoea)	Withhold treatment. Prompt diagnostic evaluation required and benefit/risk ratio should be considered prior to continuing bortezomib therapy.
	Posterior Reversible Encephalopathy Syndrome (PRES)	Discontinue bortezomib
Thalidomide	Angioedema	Discontinue thalidomide

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 6 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. 	Skin rash	Withhold treatment and evaluate clinically. If allergic reaction do not resume treatment.
	Thromboembolic Event	Withhold treatment and start standard anticoagulant therapy. Once stabilised on the anticoagulant therapy and complications of thromboembolic event have been managed, thalidomide treatment may be restarted at the original dose dependant on a benefit/risk assessment. Anticoagulant therapy should be continued during the course of thalidomide treatment.

SUPPORTIVE CARE:

EMETOGENIC POTENTIAL:

Daratumumab: Minimal **(Refer to local policy)**.
 Bortezomib: Low **(Refer to local policy)**.
 Thalidomide: Minimal to low **(Refer to local policy)**.

PRE AND POST MEDICATIONS FOR DARATUMUMAB INJECTION:

- Pre-dose medications consisting of corticosteroid, anti-pyretic and anti-histamines should be administered to reduce the risk of IRRs to all patients 1-3 hours prior to every dose of daratumumab as suggested in table 9.
- When dexAMETHasone is the background-regimen specific corticosteroid, the dexAMETHasone treatment dose will instead serve as pre-medication on daratumumab dosing days. Additional background regimen specific corticosteroids (e.g. prednisolone) should not be taken on daratumumab dosing days when patients have received dexAMETHasone as a pre-medication.
- Consider use of montelukast 10mg PO 60 minutes pre-daratumumab before the first dose only to reduce the incidence of infusion-related reactions
- See other supportive care for recommended post-infusion medications

Table 9: Suggested medications for pre and post daratumumab administration

Day	Drugs	Dose	Route	Timing	Cycle
1, 2, 8, 9, 15, 16	dexAMETHasone	Refer to Table 1: Treatment table for daratumumab, bortezomib, thalidomide and dexAMETHasone			All cycles
1, 15	Paracetamol	1g	PO	1-3 hours prior to daratumumab injection	All cycles
1, 15	Chlorphenamine ^a	4mg	PO	1-3 hours prior to daratumumab injection	All cycles

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a

<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE's terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p><i>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</i></p>		

^aOr equivalent oral or intravenous antihistamine

OTHER SUPPORTIVE CARE:

- Anti-viral prophylaxis should be considered for the prevention of herpes zoster virus reactivation. **(Refer to local policy).**
- Bisphosphonates should be considered in all patients with myeloma related bone disease.
- Tumour lysis syndrome prophylaxis **(Refer to local policy).**
- H2 antagonist or proton pump inhibitor **(Refer to local policy).**
- Consider PJP prophylaxis **(Refer to local policy).**
- Influenza vaccination in appropriate patients
- Women of child-bearing potential should use effective contraception during, and for 3 months after cessation of daratumumab treatment. Women of child-bearing potential should use effective contraception without interruption for at least 4 weeks prior to starting thalidomide treatment, throughout the entire duration of treatment and at least 4 weeks after the end of treatment
- Male patients must use condoms during treatment, during dose interruption and for at least 7 days following discontinuation of treatment if their partner is pregnant or is of childbearing potential not using effective contraception. Male patients should not donate semen or sperm during treatment (including during dose interruptions) and for at least 7 days following discontinuation of thalidomide.
- Prophylactic laxatives to prevent thalidomide induced constipation **(Refer to local policy).**
- **Recommended post-infusion medications for patients with a history of obstructive pulmonary disorder**
 - The use of post-infusion medications including short and long acting bronchodilators, and inhaled corticosteroids should be considered. Following the first four infusions, if the patient experiences no major IRRs, these inhaled post-infusion medications may be discontinued at the discretion of the physician

ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS:

The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

- **Hepatitis B Reactivation:** HBV screening should be performed in all patients before initiation of treatment. Patients should be tested for both HBsAg and HBcoreAb as per local policy. If either test is positive, liaise with local hepatology/infectious diseases services regarding PCR testing and appropriate anti-viral prophylaxis. For patients with evidence of positive HBV serology, monitor for clinical and laboratory signs of HBV reactivation during, and for at least six months following the end of treatment. Manage patients according to current clinical guidelines.

Daratumumab:

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 8 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE's terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p><i>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</i></p>		

- Interference with Indirect Antiglobulin Test (Indirect Coombs Test):** Daratumumab binds to CD38 found at low levels on red blood cells (RBCs) and may result in a positive indirect Coombs test. Daratumumab mediated positive indirect Coombs test may persist for up to 6 months after the last daratumumab infusion. It should be recognised that daratumumab bound to RBCs may mask detection of antibodies to minor antigens in the patient’s serum. The determination of a patient’s ABO and Rh blood type are not impacted. Patients should be typed and screened prior to starting daratumumab treatment. Phenotyping may be considered prior to starting daratumumab treatment as per local practice. Red blood cell genotyping is not impacted by daratumumab and may be performed at any time. In the event of a planned transfusion blood transfusion centres should be notified of this interference with indirect antiglobulin tests. If an emergency transfusion is required, non-cross-matched ABO/RhD compatible RBCs can be given per local blood bank practices.
- Interference with determination of Complete Response:** Daratumumab is a human IgG kappa monoclonal antibody that can be detected on both the serum protein electrophoresis (SPE) and immunofixation (IFE) assays used for the clinical monitoring of endogenous M-protein. This interference can impact the determination of complete response and of disease progression in some patients with IgG kappa myeloma protein.
 - Consider use of daratumumab-specific IFE reflex assay (DIRA) to distinguish the therapeutic from the patient’s M protein. The DIRA assay can be used to determine whether additional testing, including determination of the sFLC ratio and BM evaluation, is warranted in patients with IgG-κ band and low measurable M protein (≤ 2 g/L) to assess the presence of (stringent) CR.

Bortezomib:

- Peripheral Neuropathy:** Patients with pre-existing severe neuropathy may be treated with bortezomib only after careful risk/benefit assessment.
- Hypotension:** Treatment is commonly associated with orthostatic/postural hypotension. A minority of patients with orthostatic hypotension experienced syncopal events. Caution is advised when treating patients with a history of syncope receiving medicinal products known to be associated with hypotension; or who are dehydrated due to recurrent diarrhoea or vomiting.
- Hepatic Impairment;** Bortezomib is metabolised by liver enzymes. Bortezomib exposure is increased in patients with moderate or severe hepatic impairment; these patients should be treated with bortezomib at reduced doses and closely monitored for toxicities.
- Haematological toxicity:** Gastrointestinal and intracerebral haemorrhage have been reported in association with bortezomib treatment. Therefore platelet counts should be monitored prior to each dose of bortezomib and bortezomib should be withheld when the platelet count is $< 25 \times 10^9$ /L. Potential benefit of treatment should be carefully weighed against the risks, particularly in case of moderate to severe thrombocytopenia and risk factors for bleeding. Complete blood counts with differential and including platelet counts should be frequently monitored throughout treatment with bortezomib. Platelet transfusion should be considered when clinically appropriate.

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a
Tumour Group: Myeloma NCCP Regimen Code: 00755	IHS Contributor: Dr Patrick Hayden	Page 9 of 13
<p>The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient’s care or treatment. Use of these documents is the responsibility of the prescribing clinician and is subject to HSE’s terms of use available at http://www.hse.ie/eng/Disclaimer</p> <p><i>This information is valid only on the day of printing, for any updates please check www.hse.ie/NCCPchemoregimens</i></p>		

- **Seizures:** Seizures have been uncommonly reported in patients without previous history of seizures or epilepsy. Special care is required when treating patients with any risk factors for seizures.
- **Posterior Reversible Encephalopathy Syndrome (PRES):** In patients developing PRES, treatment with bortezomib should be discontinued.
- **Heart Failure:** Acute development or exacerbation of congestive heart failure, and/or new onset of decreased left ventricular ejection fraction has been reported during bortezomib treatment. Patients with risk factors for or existing heart disease should be closely monitored.
- **Renal Impairment:** Patients with renal impairment should be monitored closely.

Thalidomide:

- **Teratogenic effects:** Thalidomide must never be used by women who are pregnant or by women who could become pregnant unless all the conditions of the Thalidomide Pregnancy Prevention Programme are met. These conditions must be fulfilled for all male and female patients.
- **Venous and arterial thromboembolic events:** There is an increased risk of venous and arterial thromboembolism in patients treated with thalidomide particularly during the first 5 months of therapy. Previous history of thromboembolic events may also increase thromboembolic risk in these patients. Thromboprophylaxis should be considered especially in patients with additional thrombotic risk factors.
- **Allergic reactions and severe skin reactions:** Cases of allergic reactions including angioedema, anaphylactic reaction and severe cutaneous reactions including Stevens-Johnson syndrome (SJS), toxic epidermal necrolysis (TEN), and drug reaction with eosinophilia and systemic symptoms (DRESS) have been reported with the use of Thalidomide. Patients should be advised of the signs and symptoms of these reactions by their prescribers and should be told to seek medical attention immediately if they develop these symptoms. Thalidomide interruption or discontinuation should be considered for Grade 2-3 skin rash. Thalidomide must be discontinued for angioedema, anaphylactic reaction, Grade 4 rash, exfoliative or bullous rash, or if SJS, TEN or DRESS is suspected, and should not be resumed following discontinuation for these reactions.
- **Somnolence:** Patients should be monitored and dose reduction may be required.

dexAMETHasone

- **Steroid use:** Steroid use is associated with numerous side effects including insomnia, gastric irritation, increased blood sugar levels, mood changes, increased appetite, bruising, skin fragility and osteoporosis (long term use).

DRUG INTERACTIONS:

- Current drug interaction databases should be consulted for more information.
- No interaction studies have been performed with daratumumab.
- Additive hypotensive effect with anti-hypertensives and bortezomib. Blood pressure should be monitored and ensure patient is well hydrated prior to bortezomib dose. Adjustment of

NCCP Regimen: Daratumumab (SC), Bortezomib, Thalidomide and dexAMETHasone Consolidation Therapy	Published: 30/5/2022 Review: 20/11/2028	Version number: 2a

anti-hypertensives may be required.

- During clinical trials, hypoglycemia was uncommonly reported and hyperglycemia commonly reported in diabetic patients receiving oral hypoglycemics. Patients on oral anti-diabetic agents receiving bortezomib treatment may require close monitoring of their blood glucose levels and adjustment of the dose of their anti-diabetic medications.
- Patients should be closely monitored when given bortezomib in combination with potent CYP3A4-inhibitors. Caution should be exercised when bortezomib is combined with CYP3A4- or CYP2C19 substrates.
- Thalidomide may enhance the sedation induced by anxiolytics, hypnotics, antipsychotics, H1 antihistamines, opiate derivatives, barbiturates and alcohol.
- Due to thalidomide’s potential to induce bradycardia, caution should be exercised with medicinal products having the same pharmacodynamic effect such as active substances known to induce torsade de pointes, beta blockers or anticholinesterase agents.
