<td></td>
</tr>
</tbody>
</table>

TREATMENT:
The starting dose of the drugs detailed below may be adjusted downward by the prescribing clinician, using their independent medical judgement, to consider each patient's individual clinical circumstances.

The recommended dose of SUNitinib is 37.5mg once daily continuously until disease progression or unacceptable toxicity occurs. A treatment cycle consists of 4 weeks of treatment.

<tbody>
<tr>
<td>SUNitinib</td>
<td>37.5mg daily</td>
<td>PO once daily at the same time every day, consistently either with or</td>
<td>Continuous</td>
</tr>
<tr>
<td></td>
<td></td>
<td>without food. Swallow whole with a glass of water</td>
<td></td>
</tr>
</tbody>
</table>

ELIGIBILITY:
- Indications as above
- ECOG 0-2

EXCLUSIONS:
- Hypersensitivity to SUNitinib, or any of the excipients
- Significant cardiovascular disease and/or LVEF < 55
- Uncontrolled hypertension
- Pregnancy
- Lactation

PRESCRIPTIVE AUTHORITY:
The treatment plan must be initiated by a Consultant Medical Oncologist.

TESTS:
Baseline tests:
- FBC, renal and liver profile.
- Thyroid Function tests
- Blood pressure
- MUGA scan or echocardiogram if clinically indicated or history of cardiac problems

Regular tests:
- FBC, renal and liver profile
- Thyroid function tests every 4 weeks
- Blood pressure weekly for first 6 weeks and then every 4 weeks
- MUGA scan or echocardiogram as clinically indicated

NCCP Regimen: SUNitinib 37.5mg Therapy
Published: 03/06/2016
Review: 30/05/2020
Version number: 3

Tumour Group: Neuroendocrine
NCCP Regimen Code: 00327
ISMO Contributor: Prof Maccon Keane

The information contained in this document is a statement of consensus of NCCP and ISMO or IHS professionals regarding their views of currently accepted approaches to treatment. Any clinician seeking to apply or consult these documents is expected to use independent medical judgement in the context of individual clinical circumstances to determine any patient's care or treatment. Use of these documents is the responsibility of the prescribing clinician. and is subject to HSE’s terms of use available at [http://www.hse.ie/eng/Disclaimer](http://www.hse.ie/eng/Disclaimer)

This information is valid only on the day of printing, for any updates please check [www.hse.ie/NCCPchemoregimens](http://www.hse.ie/NCCPchemoregimens)
Disease monitoring:
Disease monitoring should be in line with the patient’s treatment plan and any other test/s as directed by the supervising Consultant.

DOSE MODIFICATIONS:
- Any dose modification should be discussed with a Consultant.
- Dose modifications in 12.5 mg steps may be applied based on individual safety and tolerability.
  - Dose level -1: 25mg
  - Dose level +1: 50mg
- A dose increase to a maximum of 62.5 mg should be considered if SUNitinib must be co-administered with a CYP3A4 inducer. If dose is increased, the patient should be monitored carefully for toxicity.
- Co-administration of SUNitinib with potent CYP3A4 inhibitors, should be avoided. If this is not possible, the dose of SUNitinib may need to be reduced to a minimum of 25 mg daily for based on careful monitoring of tolerability.
- Dose interruptions may be required based on individual safety and tolerability.
- Dose escalation: May increase to +1 dose level if no response after 8 weeks, with grade 1 or lower non-haematologic or grade 2 or lower haematologic treatment related adverse events.

SUPPORTIVE CARE:
EMETOGENIC POTENTIAL: Low (Refer to local policy).
PREMEDICATIONS: None required

OTHER SUPPORTIVE CARE:
Anti-diarrhoeal treatment may be required

ADVERSE EFFECTS / REGIMEN SPECIFIC COMPLICATIONS
The adverse effects listed are not exhaustive. Please refer to the relevant Summary of Product Characteristics for full details.

- **Cardiac Toxicity:** Cardiovascular events, including heart failure, cardiomyopathy, and myocardial ischemia and myocardial infarction, some of which were fatal, have been reported in patients treated with Sunitinib. These data suggest that Sunitinib increases the risk of cardiomyopathy. No specific additional risk factors for Sunitinib-induced cardiomyopathy apart from the drug-specific effect have been identified in the treated patients. Use of Sunitinib with caution in patients who are at risk for, or who have a history of, these events. Baseline and periodic evaluations of LVEF should also be considered while the patient is receiving Sunitinib.

- **QT prolongation:** QT interval prolongation may lead to an increased risk of ventricular arrhythmias including Torsade de pointes. Torsade de pointes has been observed in <0.1% of Sunitinib-exposed patients. Sunitinib should be used with caution in patients with a known history of QT interval prolongation, patients who are taking antiarrhythmics, or medicinal products that can prolong QT interval, or patients with relevant pre-existing cardiac disease, bradycardia, or electrolyte disturbances.

- **Hypertension:** Patients should be screened for hypertension and controlled as appropriate. Temporary suspension is recommended in patients with severe hypertension that is not controlled with medical management. Treatment may be resumed once hypertension is appropriately controlled.

- **Aneurysms and artery dissections:** The use of vascular endothelial growth factor (VEGF) pathway inhibitors in patients with or without hypertension may promote the formation of aneurysms and/or artery dissections. Before initiating sunitinib, this risk should be carefully considered in patients with risk factors such as hypertension or history of aneurysm.

- **Hypothyroidism:** Baseline laboratory measurement of thyroid function is recommended in all patients. Patients with pre-existing hypothyroidism or hyperthyroidism should be treated as per standard medical practice prior to the start of Sunitinib treatment. During Sunitinib treatment, routine monitoring of thyroid function should be performed. Patients who develop thyroid dysfunction should be treated as per standard medical practice. Hypothyroidism has been observed to occur early as well as late during treatment with Sunitinib.

- **Skin and tissue disorders:** Skin discolouration, possibly due to the active substance colour (yellow), is a common adverse reaction occurring in approximately 30% of patients. Patients should be advised that depigmentation of the hair or skin may also occur during treatment with Sunitinib. Other possible dermatologic effects may include dryness, thickness or cracking of the skin, blisters, or occasional rash on the palms of the hands and soles of the feet. The above reactions were not cumulative, were typically reversible and generally did not result in treatment discontinuation.

- **Cases of pyoderma gangrenosum, generally reversible after drug discontinuation, have been reported.** Severe cutaneous reactions have been reported, including cases of erythema multiforme.
NCCP Chemotherapy Regimen

(WM) and cases suggestive of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), some of which were fatal. If signs or symptoms of SJS, TEN, or EM (e.g. progressive skin rash often with blisters or mucosal lesions) are present, SUNitinib treatment should be discontinued. If the diagnosis of SJS or TEN is confirmed, treatment must not be re-started. In some cases of suspected EM, patients tolerated the reintroduction of SUNitinib therapy at a lower dose after resolution of the reaction; some of these patients also received concomitant treatment with corticosteroids or antihistamines.

- **Wound healing**: This treatment may impair wound healing and temporary interruption of treatment is recommended in patients undergoing major surgical procedures.
- **Haemorrhage and tumour bleeding**: Haemorrhagic events, some of which were fatal, reported through post-marketing experience have included gastro-intestinal, respiratory, urinary tract and brain haemorrhages. Patients receiving concomitant treatment with anticoagulants may be periodically monitored by complete blood counts (platelets), coagulation factors (PT/INR) and physical examination.

**DRUG INTERACTIONS:**

- Co-administration with potent CYP3A4 inducers should be avoided because it may decrease SUNitinib plasma concentration.
- Limited clinical data are available on the interaction between SUNitinib and BCRP inhibitors and the possibility of an interaction between SUNitinib and other BCRP inhibitors cannot be excluded.
- Co-administration with potent CYP3A4 inhibitors should be avoided because it may increase the plasma concentration of SUNitinib.
- Current drug interaction databases should be consulted for more information.

**ATC CODE:**

SUNitinib L01XE04
